

MUSIC

the Multi-Simulation Coordinator

*Örjan Ekeberg and Mikael Djurfeldt
CSC, KTH*

The purpose of MUSIC

- ▶ On-line pre- or post-processing of huge amounts of data for a parallel simulator within the cluster
- ▶ Connect models developed for different parallel simulators
- ▶ Promote re-usability through modularity

Introduction

Recommendation from the report of the 1st INCF Workshop on Large-scale Modeling of the Nervous System:

“Implement an experimental framework for connecting software components. A feasibility study should be performed regarding the possibility of on-line communication between different software modules, for example two parallel simulators. INCF should allocate resources for implementing a software library with a communication interface.”

- ▶ MUSIC standard and software provided and supported by the International Neuroinformatics Coordinating Facility (INCF)
- ▶ Being developed by the CSC, KTH in a collaborative partnership with the INCF
- ▶ Released publicly under the GPL license through the INCF Software Center in early 2009

Introduction

Design Goals

- ▶ **Portability**

Based on C++ and MPI

- ▶ **Simplicity**

Minimal impact on existing simulators

- ▶ **Independence**

Encourage independent tool development

- ▶ **Performance**

High bandwidth, low latency through use of MPI

- ▶ **Extensibility**

Some classes in API can be subclassed

- ▶ MUSIC-adapted applications present **Ports**
- ▶ Ports have **names**
- ▶ User **connects** ports via a *configuration file*

Users View of MUSIC

MUSIC

Örjan Ekeberg and
Mikael Djurfeldt

Typical configuration file `my_simulation.music`:

```
stoptime=1.0
[model]
  binary=nrniv
  args=my_simulation.hoc
  np=40
[EEG]
  binary=eegsynthesizer
  args=geometry.dat 50e-6 10
  np=12
  model.eneurons -> input[1600]
```

```
mpirun -np 52 music my_simulation.music
```

Execution goes through three phases

- ▶ **Launch phase**
Outside the control of the application
- ▶ **Setup phase**
Declaration and mapping of ports
- ▶ **Runtime phase**
Simulation and transfer of data

Each application is responsible for:

1. Initializing MUSIC
2. Creating Ports
3. Mapping Ports
4. Initiating the Runtime Phase
5. Advancing Simulation Time

Initializing MUSIC

```
int main (int argc, char *argv [])
{
    setup = MUSIC::setup (argc, argv);
    comm = setup->communicator ();
    ...
}
```

Programmers View of MUSIC

Programs announce willingness to send or receive data via **ports**

Creating and mapping a port

```
p = setup->publish_cont_output ("out");  
  
array_data m (state_vars, MPI::DOUBLE,  
             mybase, mysize);  
p -> map (&m);
```

Supported Data Types

- ▶ **Continuous** — Time varying values
 - Sender: Reading from user data structures
 - Receiver: Writing into user data structures
- ▶ **Events** — Spikes
 - Sender: User calls an insertion function
 - Receiver: MUSIC calls user-supplied handler
- ▶ **Messages** — Arbitrary strings of bytes
 - Sender: User calls an insertion function
 - Receiver: MUSIC calls user-supplied handler

Initiating the runtime phase

```
...  
runtime = new MUSIC::runtime (setup, 0.0001);  
  
while (runtime->time () < stoptime)  
{  
    ...  
    runtime->tick ();  
    ...  
}
```

What goes on behind the scene?

- ▶ **Spatial Aliasing**

 - Data resides on different processors

- ▶ **Temporal Aliasing**

 - Different applications may use different time steps
